

Homework 2

Due Tuesday 1/28/2014 - at beginning of class

Reading Assignment - Chapter 2.1-2.3

Griffiths Problems, 4th Edition

Each problem should be started on its own piece of paper. Points will be removed from solutions that are difficult to read.

1.44

2.6

2.15

2.17

2.20

Problem E.2.1 A non-uniform semi-infinite cylindrical volume charge with volume charge density $\rho = \gamma s^2$ occupies the region $s < a$. Compute the electric field inside ($s < a$) and the field outside ($s > a$) the volume charge, that is compute the field everywhere.

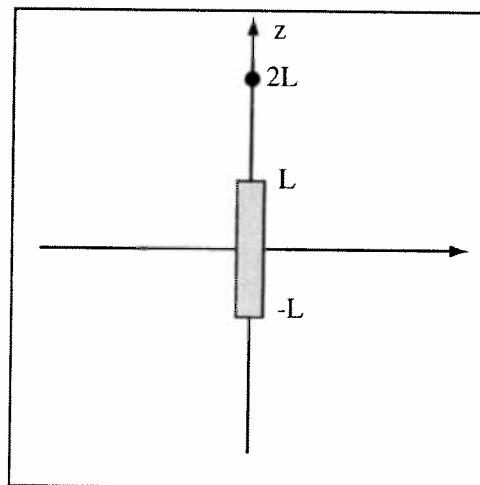

Problem E.2.2 For each of the following fields, determine if the field is a possible electromagnetic field; that is, which of the following fields obey Maxwell's equations.

(a) $\vec{E} = \gamma r^2 \hat{r}$ in spherical coordinates

(b) $\vec{B} = \gamma s^2 \hat{s}$ in cylindrical coordinates

Problem E.2.3 A square of charge with uniform charge density σ lies in the $x-y$ plane, centered at the origin. The square has side of length $2a$. Calculate the field at a point a distance $R > a$ along the y axis.

Problem E.2.4 A finite linear charge occupies the region between $-L$ and $+L$ along the z axis and has uniform linear charge density λ . Calculate the electric field at a point a distance $2L$ along the z axis.

1.44

(a)

$x = 3$ is in the integral range

$$\int_2^6 (3x^2 - 2x - 1) \sigma(x-3) dx = \frac{3(3)^2 - 2 \cdot 3 - 1}{27} - 6 - 1 \\ = 20$$

(b) $\pi \in [0, 5]$ so

$$\int_0^5 \cos x \delta(x-\pi) dx = \cos \pi = -1$$

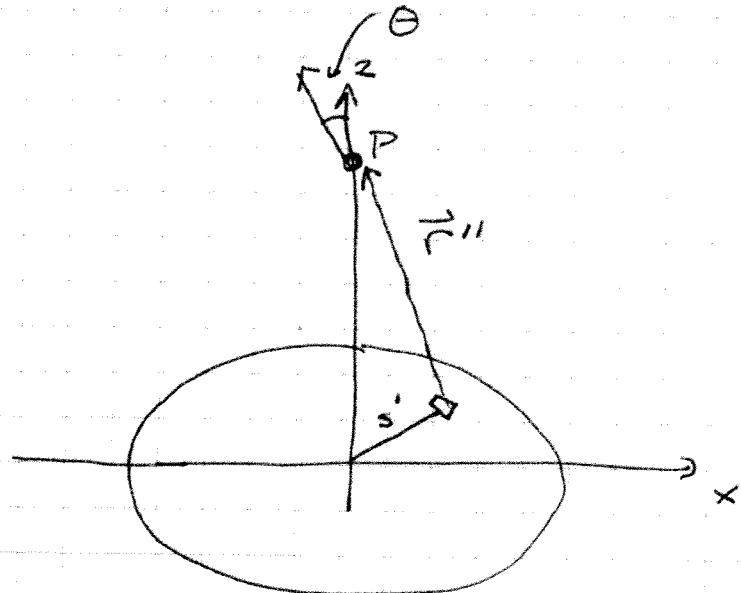

(c) $* -1 \notin [0, 3]$

$$\int = 0$$

(d) $x = -2 \in [-\infty, \infty]$

$$\int_{-\infty}^{\infty} \ln(x+3) \sigma(x+2) dx = \ln(-2+3) = \ln(1) \\ = 0$$

(2.6)

$$\vec{r}_p = (0, 0, z) \quad \vec{r}' = \hat{s}' \hat{s}'$$

$$\vec{r}'' = \vec{r}_p - \vec{r}' = -\hat{s}' \hat{s}' + z \hat{z}$$

$$r'' = \sqrt{s'^2 + z^2}$$

The field points in the $+z$ direction by symmetry,
so only the z -component of the field survives
integration.

$$(d\vec{E})_z = \frac{k dq}{r'^{1/2}} \cos \theta$$

$$\cos \theta = \frac{z}{\sqrt{z^2 + s'^2}}$$

$$|E|_z = \int \frac{k dq}{r^{1/2}} \frac{z}{\sqrt{z^2 + s'^2}}$$

$$= \int \frac{k \sigma ds' z}{(z^2 + s'^2)^{3/2}}$$

$$= k \sigma z \int_0^R ds' \int_0^{2\pi} s' d\phi' \frac{1}{(z^2 + s'^2)^{3/2}}$$

$$= 2\pi k \sigma z \int_0^R ds' \frac{1}{(z^2 + s'^2)^{3/2}}$$

$$= 2\pi k \sigma z \left(\frac{1}{z} - \frac{1}{\sqrt{R^2 + z^2}} \right)$$

$$\vec{E} = \frac{\sigma z \hat{z}}{2\epsilon_0} \left(\frac{1}{z} - \frac{1}{\sqrt{R^2 + z^2}} \right)$$

If $R \rightarrow \infty$, $\vec{E} = \frac{\sigma}{2\epsilon_0} \hat{z}$ the field of an infinite plane.

If $z \rightarrow \infty$, $\frac{1}{\sqrt{R^2 + z^2}} \rightarrow \frac{1}{z \sqrt{1 + R^2/z^2}}$

$$= \frac{1}{z} \left(1 - \frac{1}{2} \frac{R^2}{z^2} + \dots \right)$$

by the binomial thm $(1+x)^n \sim 1+nx+\dots$

$$\vec{E} \rightarrow \frac{\sigma z \hat{z}}{2\epsilon_0} \left(\frac{1}{z} - \frac{1}{z} \left(1 - \frac{1}{2} \frac{R^2}{z^2} \right) \right)$$

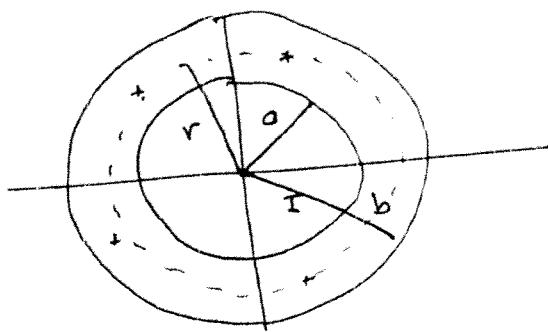

$$= \frac{\sigma R^2}{4\epsilon_0 z^2} \hat{z} = \frac{q(\pi R^2 \sigma)}{4\pi \epsilon_0 z^2} \hat{z}$$

= Field of point charge with charge

$$Q = \pi R^2 \sigma \quad \checkmark$$

2.15

$$\rho = \frac{k}{r^2}$$

The charge enclosed in a Gaussian surface
with $a < r < b$ drawn above

$$Q_{\text{enc}} = \int \rho dV$$

$$= \int_a^b 4\pi r^2 \rho dr$$

$$= \int_a^r 4\pi r^2 \cdot \frac{k}{r^2} dr] \text{ shell method}$$

$$= 4\pi k(r-a)$$

The total charge of the shell is

$$Q_T = 4\pi k(b-a)$$

Inside all charge $r < a$

$$\vec{E} = 0$$

Outside all charge $r > b$

$$\vec{E} = \frac{Q_T}{4\pi\epsilon_0 r^2} \hat{r}$$

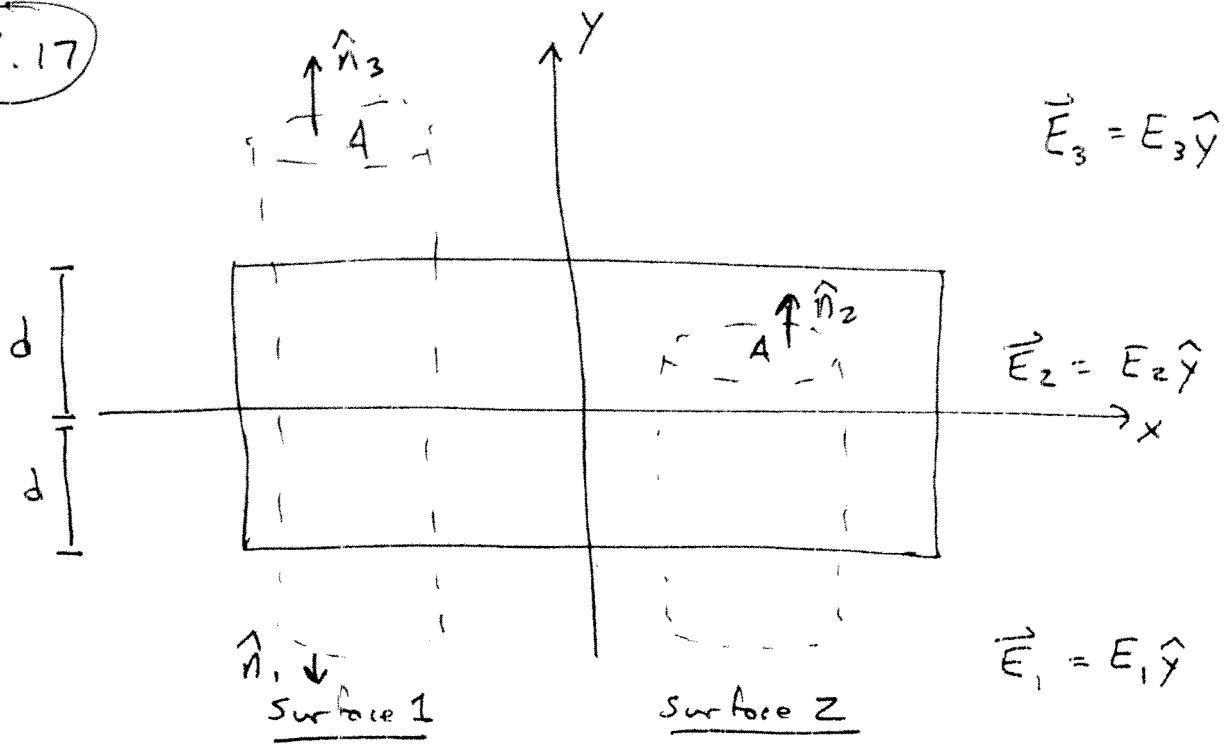

field of point charge with total charge
of system.

In volume charge $a < r < b$

$$\Phi = 4\pi r^2 E = \frac{Q_{enc}}{\epsilon_0} \quad \text{Gauss Law}$$

$$\vec{E} = \frac{Q_{enc}}{4\pi\epsilon_0 r^2} \hat{r} = \frac{4\pi k(r-a)}{4\pi\epsilon_0 r^2} \hat{r}$$

Z.17

Surface 1 $Q_{\text{enc}} = 2dA \rho \quad \hat{n}_3 = \hat{y} \quad \hat{n}_1 = -\hat{y}$

$$\Phi = \vec{E}_3 \cdot \hat{n}_3 A + \vec{E}_1 \cdot \hat{n}_1 A$$

$$= E_3 A + (-E_1 A) = \frac{Q_{\text{enc}}}{\epsilon_0} \quad \text{Gauss}$$

By symmetry $E_3 = -E_1$

$$2E_3 A = \frac{Q_{\text{enc}}}{\epsilon_0} = \frac{2dA \rho}{\epsilon_0}$$

$$E_3 = \frac{d\rho}{\epsilon_0} = \frac{dP}{\epsilon_0}$$

$$\vec{E}_3 = \frac{\rho d}{\epsilon_0} \hat{y} \quad \vec{E}_1 = -\frac{\rho d}{\epsilon_0} \hat{y}$$

Surface 2 $Q_{enc} = \rho A(y+d)$

$$\begin{aligned}\Phi &= \vec{E}_2 \cdot \hat{n}_2 A + \vec{E}_1 \cdot \hat{n}_1 A \\ &= E_2 A - E_1 A = \frac{Q_{enc}}{\epsilon_0} = \frac{\rho A(y+d)}{\epsilon_0}\end{aligned}$$

$$\begin{aligned}E_2 &= E_1 + \frac{\rho(y+d)}{\epsilon_0} \\ &= -\frac{\rho d}{\epsilon_0} + \frac{\rho(y+d)}{\epsilon_0} = \frac{\rho y}{\epsilon_0}\end{aligned}$$

$$\vec{E}_2 = \frac{\rho y}{\epsilon_0} \hat{y}$$

(2.20) To be possible, the field must be curl free.

(a)

$$\nabla \times \vec{E} = \kappa \begin{vmatrix} \hat{x} & \hat{y} & \hat{z} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ xy & 2yz & 3xz \end{vmatrix}$$

$$= \hat{x}(0 - 2y) \neq 0 \quad \text{not an electric field}$$

$$+ \hat{y}()$$

$$+ \hat{z}()$$

(b)

$$\nabla \times \vec{E} = \kappa \begin{vmatrix} \hat{x} & \hat{y} & \hat{z} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y^2 & (2xy + z^2) & 2yz \end{vmatrix}$$

$$= [\hat{x}(zz - 2z) - \hat{y}(0 - 0) + \hat{z}(2y - 2y)] \kappa$$

= 0 can be electric field.

$$\vec{E} = -\nabla V$$

$$\vec{E} \cdot d\vec{l} = -\frac{\partial V}{\partial x} dx - \frac{\partial V}{\partial y} dy - \frac{\partial V}{\partial z} dz$$

$$\frac{\partial V}{\partial x} = -kx^2$$

$$V = -kx^2 + f(y, z) \quad \text{where } f \text{ is some function.}$$

$$\frac{\partial V}{\partial y} = -k(z_{xy} + z^2) = -2kxy + \frac{\partial g}{\partial y}$$

$$\frac{\partial f}{\partial y} = -kz^2$$

$$f = -kyz^2 + g(z)$$

$$V = -kx^2 - kyz^2 + g(z)$$

$$\frac{\partial V}{\partial z} = -2kyz = -2kyz + \frac{\partial g}{\partial z}$$

$$g = \text{constant}$$

$$V = -k_x y^2 - k_y z^2 + C$$

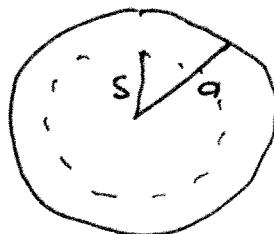

$$\vec{E} = -\nabla V = \left(+k_y^2, 2k_x y + k_z^2, 2k_y z \right) V$$

E.2.1

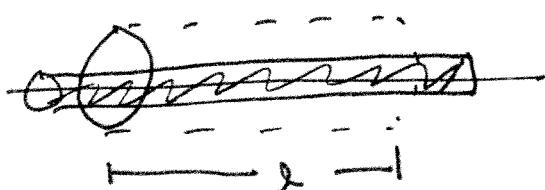

A non-uniform cylindrical volume charge occupies the region $s < a$. The volume charge density varies as $\rho(s) = \gamma s^2$. Compute the field everywhere.

Inside Charge ($s < a$)

$$Q_{\text{enc}} = \int_{\text{Gaussian surface}} \rho dV$$

$$= l \int \rho da$$

$$da = ds s d\phi$$

$$Q_{\text{enc}} = l \int_0^s ds \int_0^{2\pi} s d\phi \rho$$

$$= l \int_0^s ds \int_0^{2\pi} \gamma s^2 d\phi$$

$$= 2\pi \gamma l \int_0^s s^3 ds = 2\pi \gamma l \frac{s^4}{4}$$

$$Q_{\text{enc}} = \frac{\pi \gamma l s^4}{2}$$

For the cylindrical surface, the flux out of the surface is

$$\underline{\Phi}_c = 2\pi s l E = Q_{\text{enc}}/\epsilon_0 \quad (\text{Gauss})$$

$$E = \frac{Q_{\text{enc}}}{2\pi\epsilon_0 s l}$$

$$= \cancel{\pi} \frac{\gamma l s^4 / 2}{2\pi s l \epsilon_0}$$

$$= \frac{\gamma s^3}{4\epsilon_0}$$

$$\vec{E} = \frac{\gamma s^3}{4\epsilon_0} \hat{s}$$

For $s > a$ (outside sphere)

$$Q_{\text{enc}} = \frac{\pi \gamma l a^4}{4}$$

$$\vec{E} = \frac{Q_{\text{enc}}}{2\pi\epsilon_0 l s} \hat{s} = \frac{\pi \gamma l a^4 / \cancel{\pi}}{2\pi\epsilon_0 l s} \hat{s} = \frac{\gamma a^4}{4\epsilon_0 s} \hat{s}$$

E.2.2

(a) $\vec{E} = \gamma r^2 \hat{r}$

To be a possible EM field, the field must satisfy Maxwell's Eqsns for same, ρ , \vec{J} , \vec{B} .

Gauss $\nabla \cdot \vec{E} = \frac{\rho}{\epsilon_0}$

$$= \frac{1}{r^2} \frac{\partial r^2 A_r}{\partial r}$$

$$= \frac{\gamma}{r^2} \frac{\partial r^4}{\partial r} = \frac{4\gamma r^3}{r^2}$$

$$= 4\gamma r$$

Gauss' Law is satisfied if $\rho = 4\gamma r$.

Faraday $\nabla \times \vec{E} = 0$ satisfied if $\vec{B} = 0$

No Magnetic monopoles and Ampere satisfied if $\vec{B} = 0$, $\vec{J} = 0$, and \vec{E} constant ✓

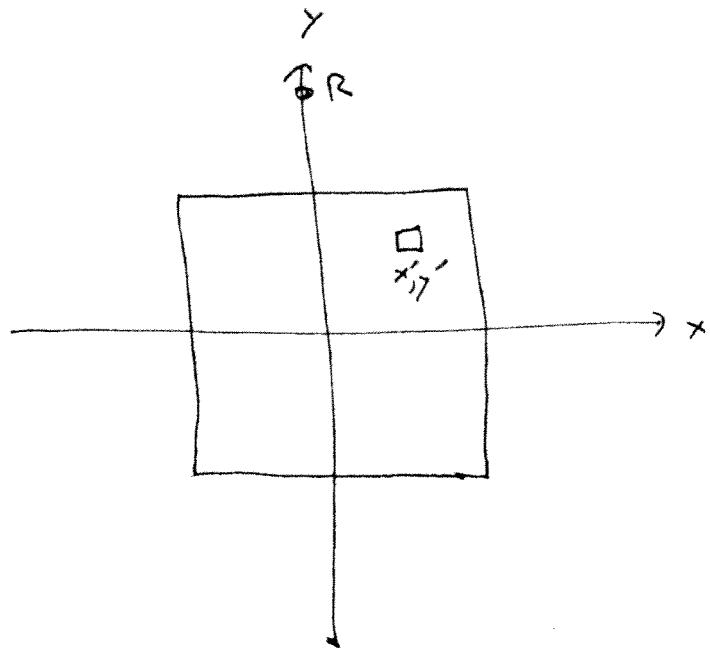

This is a possible field.

(b) $\nabla \cdot \vec{B} \neq 0 \Rightarrow$ Not a poss. b/p

EM field.

E.2.3

~~PZS~~ A square of charge $2a$ on side
with surface charge density σ .

$$\vec{r} = (0, R, 0) \quad \vec{r}' = (x', y', 0)$$

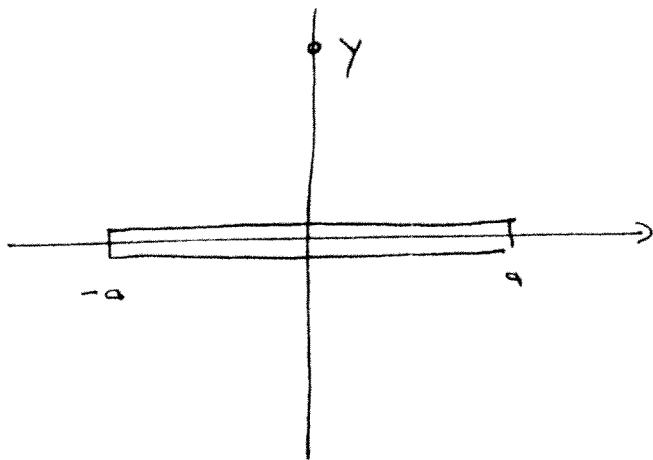

$$\vec{r}'' = \vec{r} - \vec{r}' = (-x', R-y', 0)$$

$$r'' = \sqrt{x'^2 + (R-y')^2}$$

$$\vec{E} = \int \frac{\kappa \sigma dx' dy' \vec{r}''}{r''^3}$$

Method II

- Compute field of line charge first.

$$\vec{r}' = (x', 0, 0) \quad \vec{r} = (0, y, 0)$$

$$\vec{r}'' = (-x', y, 0)$$

$$\vec{E} = \lambda k \int_{-a}^a \frac{dx' \vec{r}''}{r''^3}$$

$$E_y = \lambda k y \int_{-a}^a \frac{dx'}{(\sqrt{x'^2 + y^2})^3}$$

$$= 2\lambda k y \left. \frac{x'}{y^2 \sqrt{x'^2 + y^2}} \right|_0^a$$

$$= \frac{2\lambda k y a}{y^2 \sqrt{y^2 + a^2}} = \frac{2\lambda k}{y} \left(\frac{a}{\sqrt{y^2 + a^2}} \right)$$

Correct as $a \rightarrow \infty$

Now build square out of sequence of strips

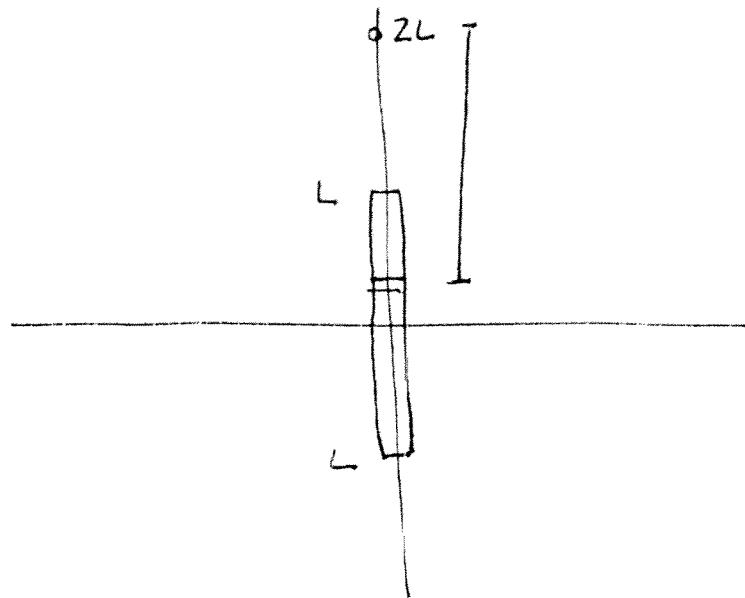

$$\vec{E}_{\text{square}} = \int_{-a}^a \vec{E}_{\text{strip}}(R-y') dy' \quad \lambda = \sigma dy'$$

$$\vec{E}_{\text{square}} = 2\sigma k \hat{y} \int_{-a}^a \frac{dy'}{(R-y') \sqrt{(R-y')^2 + a^2}}$$

$$u = R-y' \quad du = -dy' = -dy$$

$$\begin{aligned} \vec{E}_{\text{square}} &= -2\sigma k \hat{y} \int_{R+a}^{R-a} \frac{du}{u \sqrt{u^2 + a^2}} \\ &= -2k\sigma \hat{y} \left(-\frac{1}{a} \ln \left(\frac{a + \sqrt{u^2 + a^2}}{u} \right) \right) \Big|_{R+a}^{R-a} \\ &= -2k\sigma \hat{y} \left(\ln \left(\frac{a + \sqrt{(R-a)^2 + a^2}}{R-a} \right) \right. \\ &\quad \left. - \ln \left(\frac{a + \sqrt{(R+a)^2 + a^2}}{R+a} \right) \right) \end{aligned}$$

~~E.2.4~~

$$d = 2L - z$$

Coulomb's Law

$$\vec{E} = \int_{-L}^L \frac{k dq}{r''^2} \hat{r}'' + \zeta$$

$$\hat{r}'' = \hat{z}$$

$$r'' = d$$

$$\vec{E} = \hat{z} \int_{-L}^L \frac{k \lambda dz}{(2L-z)^2} + \zeta$$

$$dq = \lambda dz$$

$$z = 2L - z \quad dz = -dz$$

$$\vec{E} = -\hat{z} \int_{3L}^L \frac{k \lambda dz}{z^2} = k \lambda \hat{z} \left(\frac{1}{z} \right) \Big|_{3L}^L$$

$$\vec{E} = k\lambda \hat{z} \left(\frac{1}{L} - \frac{1}{3L} \right)$$

$$= \frac{2}{3} \frac{k\lambda}{L} \hat{z} + 10$$
